Enterprise Automation with AWX

(upstream for Ansible Automation Platform)

Agenda

What are we going to chat about?

Agenda

- Introduction
- What is AWX
- Architecture
- Installation
- Login
- Organizations
- Users
- Credentials (Github)
- Setting up a ping Project
- Ping inventory
- Setting up ssh
- Setting up credentials
- Ping template
- Setting up Apache httpd project
- Web inventory
- Apache template
- Install Apache httpd
- Remove httpd
- MariaDB Project
- MariaDB Inventory
- MariaDB Template
- Install MariaDB
- Remove MariaDB
- Live demo (time permitting)

Introduction

Who am I?

I'm Thomas Cameron (he/him)

- Been working in tech since 1993
- Started with Novell

- Worked at Microsoft during the Windows 95 launch

- Worked at Red Hat for ~ 14 years.

- Then went to AWS for 4 years

- Now Red Hat practice lead at Sparksoft Corporation

**YOU REALLY DON'T
GET OUT MUCH**

DO YOU?

imgflip.com

I'm Thomas Cameron (he/him)

- Community contact:

What is AWX

How does it relate to Ansible Automation Platform?

About AWX

- The AWX project—AWX for short—is an open source community project, sponsored by Red Hat, that enables users to better control their community Ansible project use in IT environments. AWX is the upstream project from which the automation controller component is ultimately derived. [1]
- AWX is the upstream project from which Red Hat builds their commercial product, Ansible Automation Platform (AAP).
- The UI you see is almost identical to AAP.
- The installation process is somewhat different, but not terribly

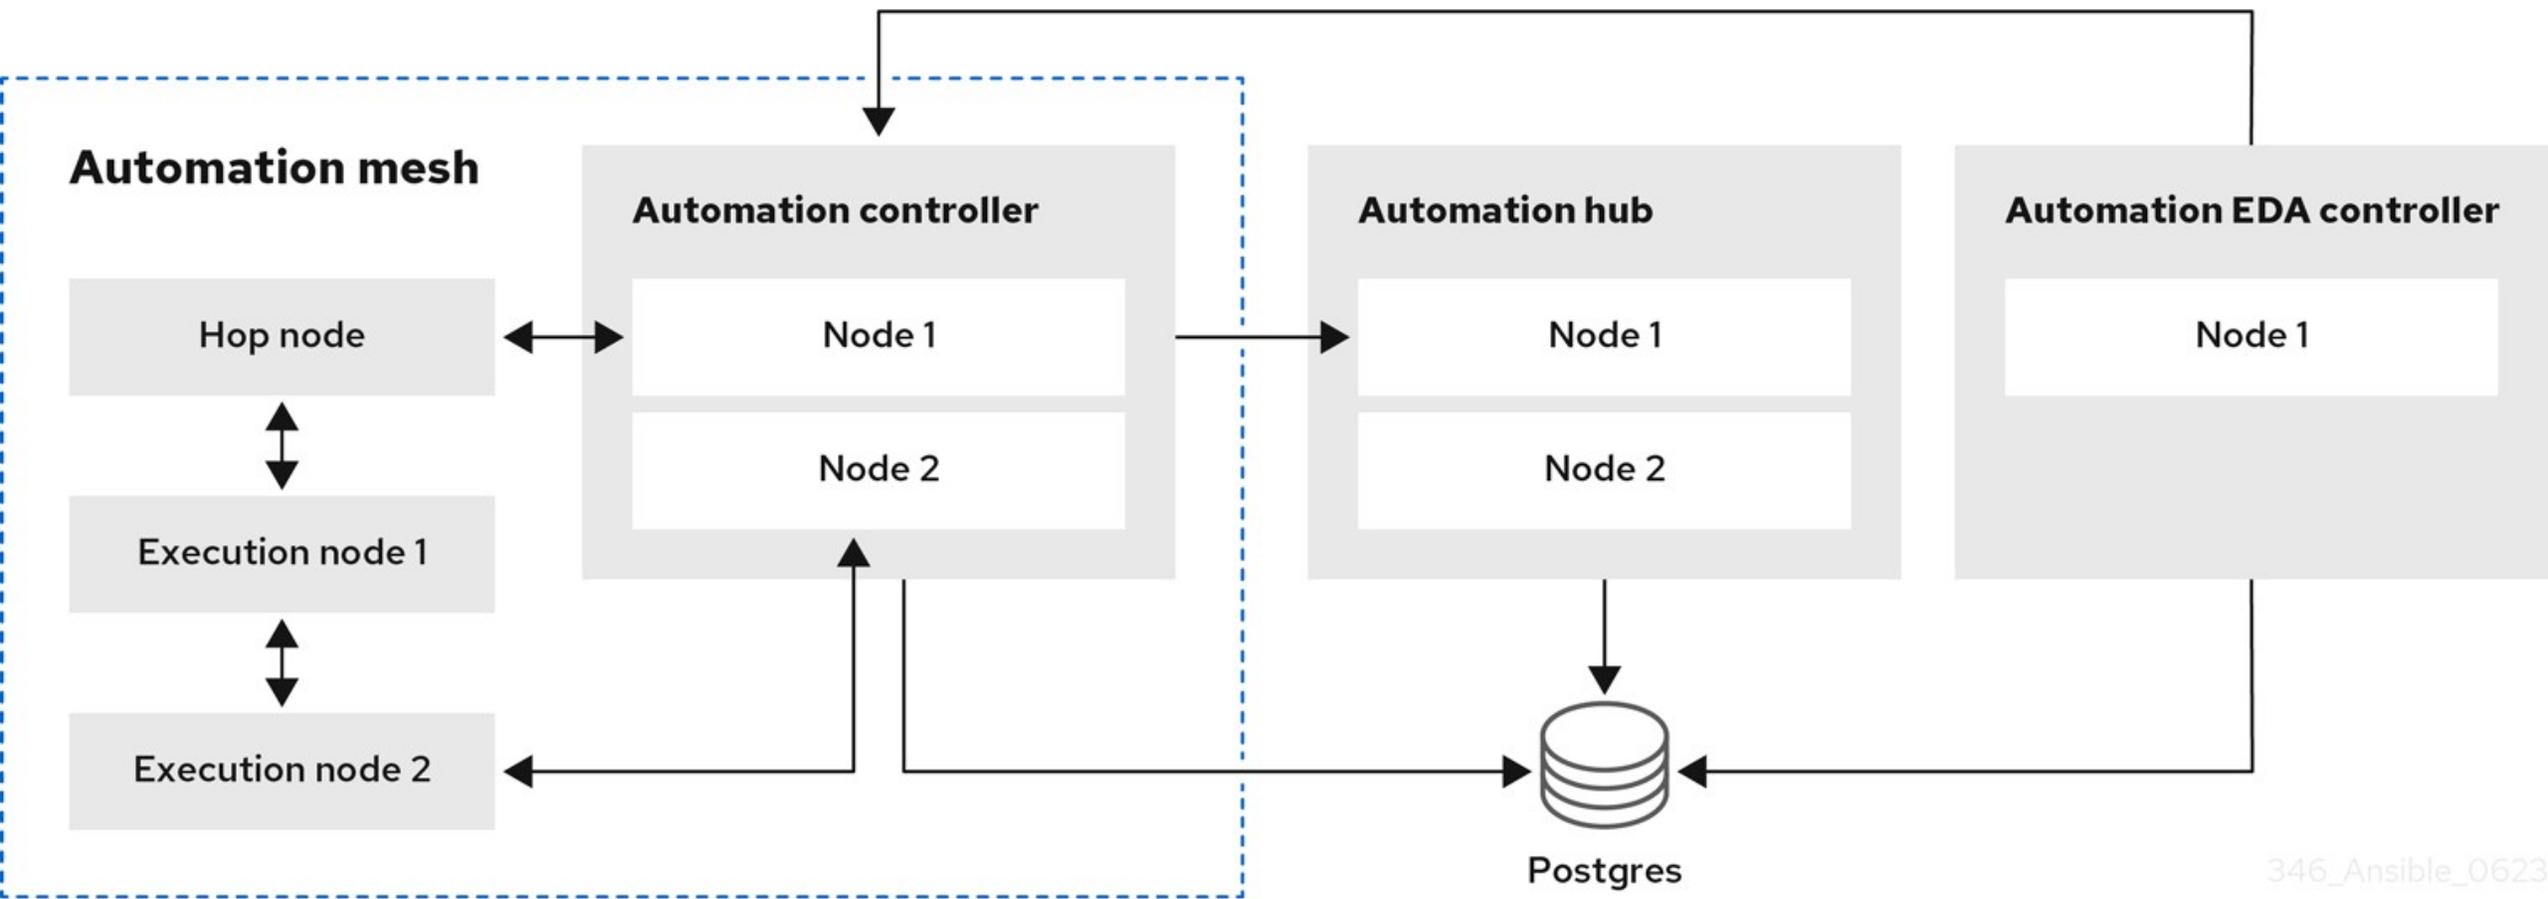

[1] <https://www.ansible.com/faq>

Architecture

How all this works together

Architecture

- Kubernetes based
- Containers for AWX management
- Containers for job management
- Containers for PostgreSQL
- Containers for the UI

346_Ansible_0620

https://access.redhat.com/documentation/en-us/red_hat_ansible_automation_platform/2.4/html/red_hat_ansible_automation_platform_planning_guide/aap_architecture

Installation

For single node

Installation

- I fought with AWX for WEEKS.
- Several resources indicate that it can be run on Fedora, RHEL/CentOS 8, and RHEL/CentOS 9.
- I was unable to get it to run on anything but RHEL8/CentOS Stream 8.

I used kurokobo's k3s method

- I tried the AWX Operator and minikube kept hanging
- I tried the docker-compose developer's build and the container builds failed repeatedly
- Was finally told about <https://github.com/kurokobo/awx-on-k3s> and it ONLY worked on RHEL/CentOS Stream 8 (not F39 or RHEL/CentOS Stream 9).

Base Install

- I used a minimal installation of CentOS Stream

AWX on Single Node K3s

An example implementation of AWX on single node K3s using AWX Operator, with easy-to-use simplified configuration with ownership of data and passwords.

- Accessible over HTTPS from remote host
- All data will be stored under `/data`
- Fixed (configurable) passwords for AWX and PostgreSQL
- Fixed (configurable) versions of AWX

If you want to view the guide for the specific version of AWX Operator, switch the page to the desired tag instead of the `main` branch.

Environment

- Tested on:
 - CentOS Stream 8 (Minimal)
 - K3s v1.28.6+k3s2
- Products that will be deployed:
 - AWX Operator 2.12.2
 - AWX 23.9.0
 - PostgreSQL 13

- [README.md on ansible/awx-operator @2.12.2](#)

Requirements

- **Computing resources**
 - **2 CPUs with x86-64-v2 support.**
 - **4 GiB RAM minimum**
 - It's recommended to add more CPUs and RAM (like 4 CPUs and 8 GiB RAM or more) to avoid performance issue and job scheduling issue.
 - The files in this repository are configured to ignore resource requirements which specified by AWX

Requirements

- **Computing resources**
 - 2 CPUs with x86-64-v2 support.
 - 4 GiB RAM minimum
 - It's recommended to add more CPUs and RAM (like 4 CPUs and 8 GiB RAM or more) to avoid performance issue and job scheduling issue.
 - The files in this repository are configured to ignore resource requirements which specified by AWX Operator by default.
- **Storage resources**
 - At least 10 GiB for `/var/lib/rancher` and 10 GiB for `/data` are safe for fresh install.
 - **Both will be grown during lifetime and actual consumption highly depends on your environment and your use case**, so you should to pay attention to the consumption and add more capacity if required.
 - `/var/lib/rancher` will be created and consumed by K3s and related data like container images and overlays.
 - `/data` will be created in this guide and used to store AWX-related databases and files.

Deployment Instruction

Prepare CentOS Stream 8 host

Disable firewalld and nm-cloud-setup if enabled. This is [recommended by K3s](#).

Deployment Instruction

Prepare CentOS Stream 8 host

Disable firewalld and nm-cloud-setup if enabled. This is [recommended by K3s](#).

```
# Disable firewalld
sudo systemctl disable firewalld --now

# Disable nm-cloud-setup if exists and enabled
sudo systemctl disable nm-cloud-setup.service nm-cloud-setup.timer
sudo reboot
```

Install the required packages to deploy AWX Operator and AWX.

```
sudo dnf install -y git curl
```

Install K3s

Install a specific version of K3s with `--write-kubeconfig-mode 644` to make the config file (`/etc/rancher/k3s/k3s.yaml`) readable by non-root users.

```
curl -sfL https://get.k3s.io | INSTALL_K3S_VERSION=v1.28.6+k3s2 sh -s - --write-kubeconfig-mode 644
```

Install AWX Operator

```
[root@host209 ~]# # I hate this advice!
```

```
[root@host209 ~]# # In the real world, I'd figure out what ports
```

```
[root@host209 ~]# # need to be open and create firewall rules!
```

```
[root@host209 ~]# 
```

```
[root@host209 ~]# systemctl disable firewalld --now  
Removed /etc/systemd/system/multi-user.target.wants/firewalld.service.  
Removed /etc/systemd/system/dbus-org.fedoraproject.FirewallD1.service.  
[root@host209 ~]#
```

```
[root@host209 ~]# sudo systemctl disable nm-cloud-setup.service nm-cloud-setup.t  
imer  
Failed to disable unit: Unit file nm-cloud-setup.service does not exist.  
[root@host209 ~]#
```

```
[root@host209 ~]# sudo dnf install -y git curl
Last metadata expiration check: 0:00:58 ago on Fri 15 Mar 2024 07:17:51 PM UTC.
Package curl-7.61.1-34.el8.x86_64 is already installed.

Installing k3s

- I totally understand why it installs this way, but...
 - Anyone else HATE mixing packaged software with downloaded zip files, shell scripts, etc?
 - Glaring at you, snap, flatpak, etc.

[README](#) [MIT license](#)

Install K3s

Install a specific version of K3s with `--write-kubeconfig-mode 644` to make the config file (`/etc/rancher/k3s/k3s.yaml`) readable by non-root users.

```
curl -sfL https://get.k3s.io | INSTALL_K3S_VERSION=v1.28.6+k3s2 sh -s - --write-kubeconfig-mode 644
```

Install AWX Operator

Warning

If you are planning that creating backup of your AWX instance using AWX Operator by referring to [the backup guide](#), AWX Operator 2.12.2 is not recommended due to [a known issue for backup](#). Use an older version of AWX Operator like [2.12.1](#) instead.

Clone this repository and change directory.

If you want to use files suitable for a specific version of AWX Operator, [refer to tags in this repository](#) and specify the desired tag in `git checkout`. Especially for `0.13.0` or earlier versions of AWX Operator, refer to

[Tips: Deploy older version of AWX Operator](#).

```
cd ~
git clone https://github.com/kurokobo/awx-on-k3s.git
cd awx-on-k3s
git checkout 2.12.2
```

File Edit View Terminal Tabs Help

Install AWX Operator

Warning

If you are planning that creating backup of your AWX instance using AWX Operator by referring to [the backup guide](#), AWX Operator 2.12.2 is not recommended due to [a known issue for backup](#). Use an older version of AWX Operator like [2.12.1](#) instead.

Clone this repository and change directory.

If you want to use files suitable for a specific version of AWX Operator, [refer to tags in this repository](#) and specify the desired tag in `git checkout`. Especially for `0.13.0` or earlier versions of AWX Operator, refer to [Tips: Deploy older version of AWX Operator](#).

```
cd ~
git clone https://github.com/kurokobo/awx-on-k3s.git
cd awx-on-k3s
git checkout 2.12.2
```

Then invoke `kubectl apply -k operator` to deploy AWX Operator.

```
kubectl apply -k operator
```

The AWX Operator will be deployed to the namespace `awx`.

```
$ kubectl -n awx get all
```

File Edit View Terminal Tabs Help

```
[sysadmin@host209 ~]$ mkdir -p Downloads/git
[sysadmin@host209 ~]$ cd Downloads/git

```

```
[sysadmin@host209 awx-on-k3s]$ git checkout 2.12.2
```

```
Note: switching to '2.12.2'.
```

You are in 'detached HEAD' state. You can look around, make experimental changes and commit them, and you can discard any commits you make in this state without impacting any branches by switching back to a branch.

If you want to create a new branch to retain commits you create, you may do so (now or later) by using `-c` with the switch command. Example:

```
git switch -c <new-branch-name>
```

Or undo this operation with:

```
git switch -
```

Turn off this advice by setting config variable `advice.detachedHead` to `false`

```
HEAD is now at 9c5df88 Merge pull request #312 from kurokobo/docs_misc
```

```
[sysadmin@host209 awx-on-k3s]$
```

[README](#) [MIT license](#)

Then invoke `kubectl apply -k operator` to deploy AWX Operator.

```
kubectl apply -k operator
```

The AWX Operator will be deployed to the namespace `awx`.

```
$ kubectl -n awx get all
```

Prepare required files to deploy AWX

Generate a Self-Signed certificate. Note that an IP address can't be specified. If you want to use a certificate from a public ACME CA such as Let's Encrypt or ZeroSSL instead of a Self-Signed certificate, follow the guide on [Use SSL Certificate from Public ACME CA](#) first and come back to this step when done.

```

Prepare required files to deploy AWX

Generate a Self-Signed certificate. Note that an IP address can't be specified. If you want to use a certificate from a public ACME CA such as Let's Encrypt or ZeroSSL instead of a Self-Signed certificate, follow the guide on [Use SSL Certificate from Public ACME CA](#) first and come back to this step when done.

```
AWX_HOST="awx.example.com"
openssl req -x509 -nodes -days 3650 -newkey rsa:2048 -out ./base/tls.crt -keyout ./base/tls.k
```

Modify `hostname` in `base/awx.yaml`.

```
...
spec:
  ...
  ingress_type: ingress
  ingress_hosts:
    - hostname: awx.example.com 🙌🙌🙌
      tls_secret: awx-secret-tls
  ...
```

Modify the two `password` entries in `base/kustomization.yaml`. Note that the `password` under `awx-postgres-configuration` should not contain single or double quotes (`'`, `"`) or backslashes (`\`) to avoid any issues during deployment, backup or restoration.

```
...
- name: awx-postgres-configuration
```

```

README MIT license

Modify the two `password` entries in `base/kustomization.yaml`. Note that the `password` under `awx-postgres-configuration` should not contain single or double quotes (`'` , `"`) or backslashes (`\`) to avoid any issues during deployment, backup or restoration.

```
...
- name: awx-postgres-configuration
  type: Opaque
  literals:
    - host=awx-postgres-13
    - port=5432
    - database=awx
    - username=awx
    - password=Ansible123!
    - type=managed

- name: awx-admin-password
  type: Opaque
  literals:
    - password=Ansible123!
```

Prepare directories for Persistent Volumes defined in `base/pv.yaml`. These directories will be used to store your databases and project files. Note that the size of the PVs and PVCs are specified in some of the files in this repository, but since their backends are `hostPath`, its value is just like a label and there is no actual capacity limitation.

```
sudo mkdir -p /data/postgres-13
```

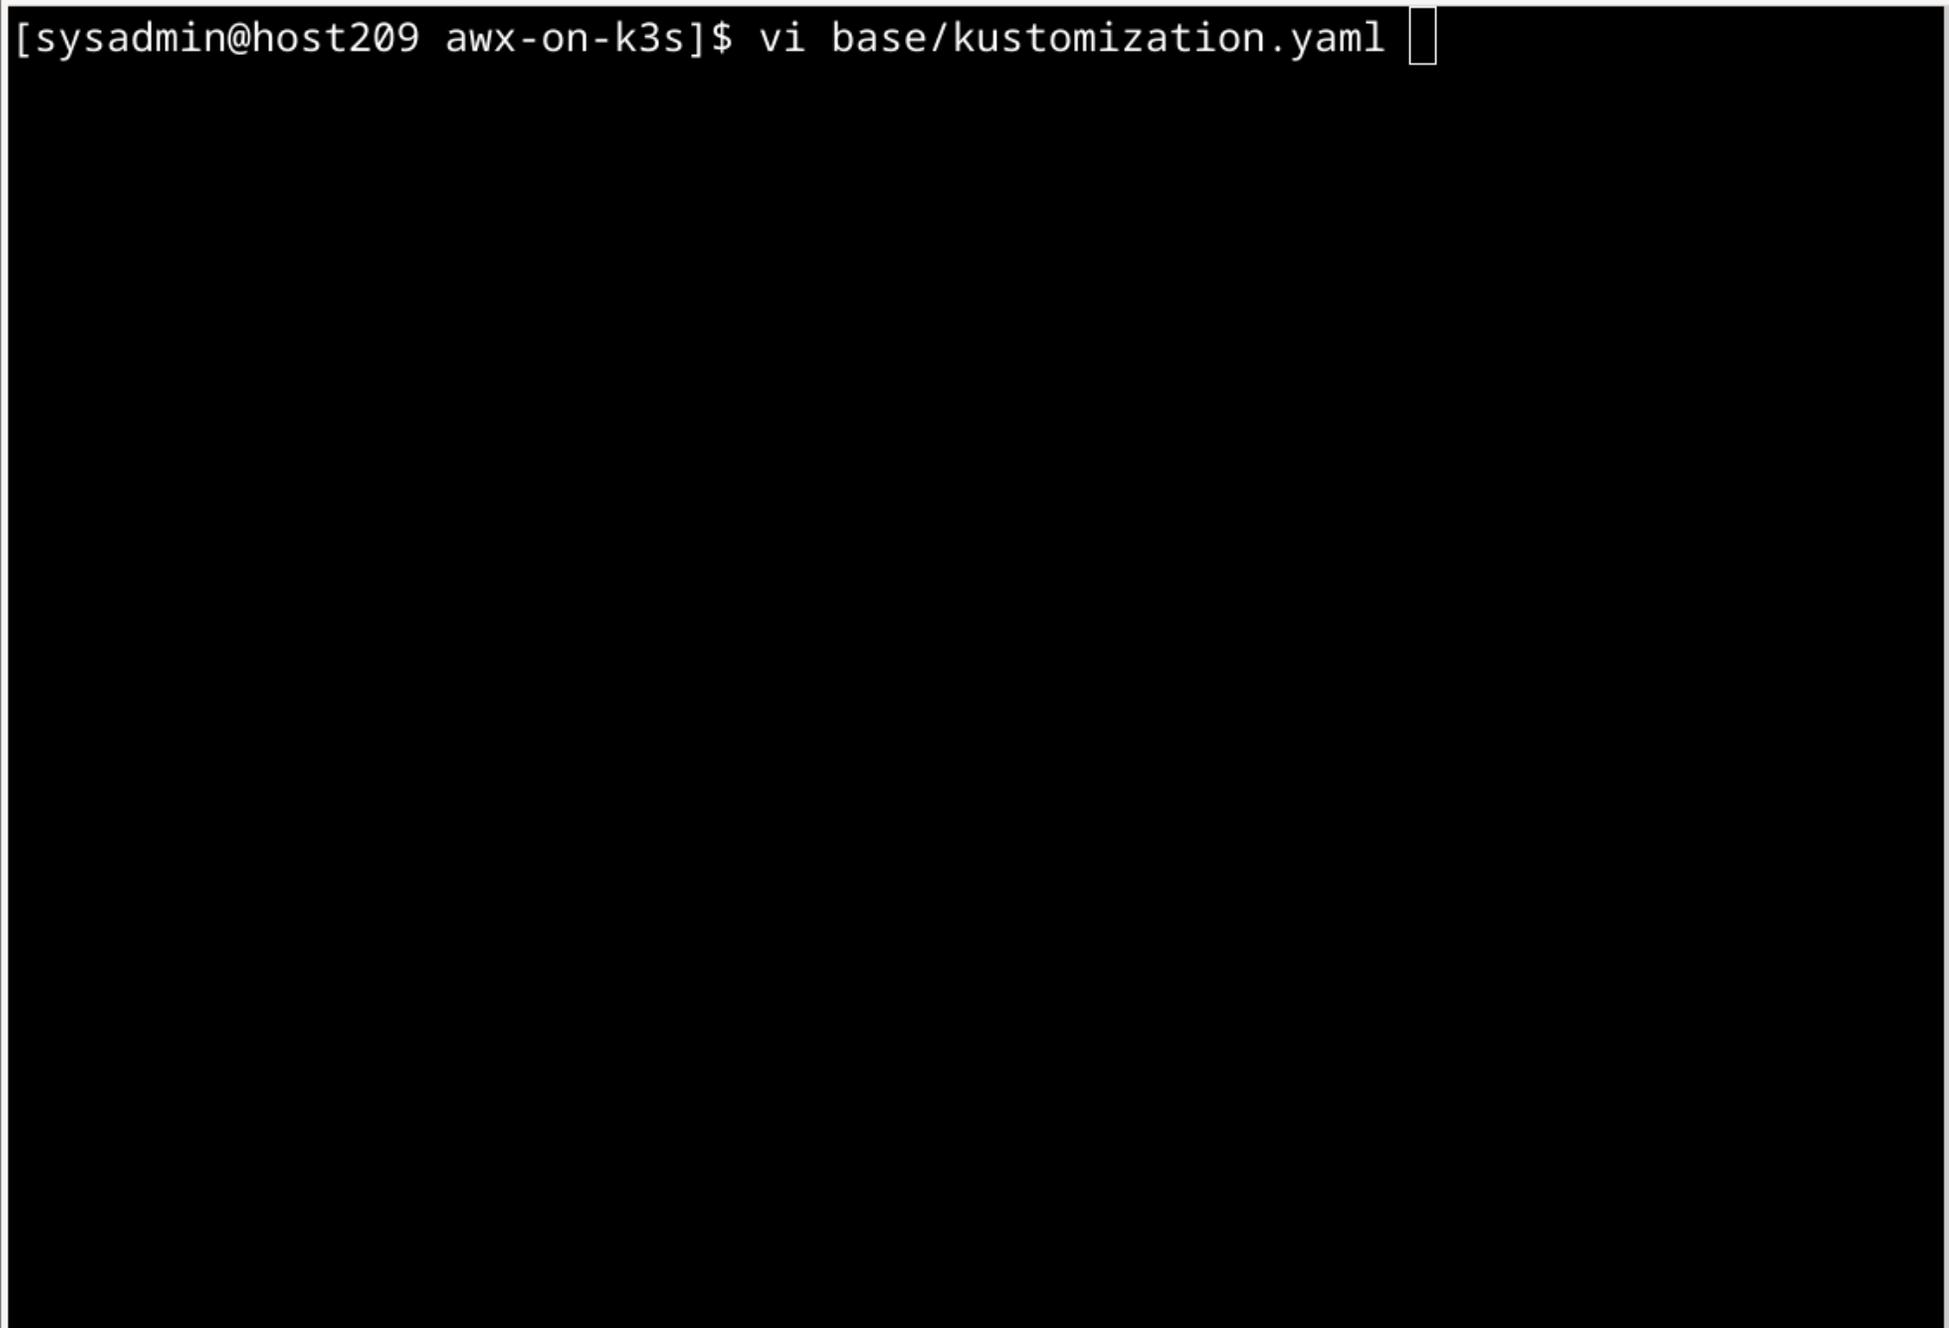

```
sudo mkdir -p /data/projects
```

```
sudo chmod 755 /data/postgres-13
```

About

AWX provides a web-based user interface, REST API, and task engine built on top of Ansible. It is one of the upstream projects for Red Hat Ansible Automation Platform.

python ansible automation django reactjs django-rest-framework hacktoberfest awx

Set up ssh

It's preferred that you have passwordless ssh logins

ssh

- Normally, I build my machines with kickstarts
 - I add the remote user (sysadmin) with NO password
 - I write the pub key to /home/sysadmin/.ssh and make sure ownership and permissions are set
- In this example, I just wanted to show you what the manual process looks like

```
sysadmin@p16s:~$ ssh-keygen -t ecdsa
Generating public/private ecdsa key pair.
Enter file in which to save the key (/home/sysadmin/.ssh/id_ecdsa):
Enter passphrase (empty for no passphrase):
Enter same passphrase again:
Your identification has been saved in /home/sysadmin/.ssh/id_ecdsa
Your public key has been saved in /home/sysadmin/.ssh/id_ecdsa.pub
The key fingerprint is:
SHA256:VIM2m0WnjfuFbg8xRy0A2TsXWp0woQWPglrq0n4Tk1A sysadmin@p16s.sparksoftcorp.i
o
The key's randomart image is:
+---[ECDSA 256]---+
|          **.*+ . |
|         E.*.o%o.o |
|        .o.o==++o  |
|       .+ .o.+..+ . |
|      o. .S .o+ o  |
|     o  +      o =  |
|    . o o      =    |
|   o o      . o    |
|  .. .          .  |
+-----[SHA256]-----+
sysadmin@p16s:~$
```

```
sysadmin@p16s:~$ ls -l .ssh/id_ecdsa*
```

```
-rw----- . 1 sysadmin sysadmin 525 Mar 15 15:51 .ssh/id_ecdsa
```

```
-rw-r--r-- . 1 sysadmin sysadmin 192 Mar 15 15:51 .ssh/id_ecdsa.pub
```

```
sysadmin@p16s:~$
```

```
sysadmin@p16s:~$ ssh-copy-id -i /home/sysadmin/.ssh/id_ecdsa.pub sysadmin@host120.virtual.lan
```

```
/usr/bin/ssh-copy-id: INFO: Source of key(s) to be installed: "/home/sysadmin/.ssh/id_ecdsa.pub"
```

```
/usr/bin/ssh-copy-id: INFO: attempting to log in with the new key(s), to filter out any that are already installed
```

```
/usr/bin/ssh-copy-id: INFO: 1 key(s) remain to be installed -- if you are prompted now it is to install the new keys
```

```
sysadmin@host120.virtual.lan's password:
```

```
Number of key(s) added: 1
```

```
Now try logging into the machine, with: "ssh 'sysadmin@host120.virtual.lan'" and check to make sure that only the key(s) you wanted were added.
```

```
sysadmin@p16s:~$
```

```
sysadmin@p16s:~$ ssh-copy-id -i /home/sysadmin/.ssh/id_ecdsa.pub host183.virtual.lan
```

```
/usr/bin/ssh-copy-id: INFO: Source of key(s) to be installed: "/home/sysadmin/.ssh/id_ecdsa.pub"
```

```
/usr/bin/ssh-copy-id: INFO: attempting to log in with the new key(s), to filter out any that are already installed
```

```
/usr/bin/ssh-copy-id: INFO: 1 key(s) remain to be installed -- if you are prompted now it is to install the new keys
```

```
sysadmin@host183.virtual.lan's password:
```

```
Number of key(s) added: 1
```

```
Now try logging into the machine, with: "ssh 'host183.virtual.lan'"  
and check to make sure that only the key(s) you wanted were added.
```

```
sysadmin@p16s:~$
```

Credentials (managed machines)

Now we tell AWX what our private key is so it can log into the managed machines
